

GDDR6 SGRAM

MT61K256M32

2 Channels x 256 Meg x 16 I/O, 2 Channels x 512 Meg x 8 I/O

Features

- $V_{DD} = V_{DDQ} = 1.35V \pm 3\%$ and $1.25V \pm 3\%$
- $V_{PP} = 1.8V - 3\% / +6\%$
- Data rate: 12 Gb/s, 14 Gb/s, 16 Gb/s
- 2 separate independent channels (x16)
- x16/x8 and 2-channel/pseudo channel (PC) mode configurations set at reset
- Single ended interfaces per channel for command/address (CA) and data
- Differential clock input CK_t/CK_c for CA per 2 channels
- One differential clock input WCK_t/WCK_c per channel for data (DQ, DBI_n, EDC)
- Double data rate (DDR) command/address (CK)
- Quad data rate (QDR) and double data rate (DDR) data (WCK), depending on operating frequency
- 16n prefetch architecture with 256 bits per array read or write access
- 16 internal banks
- 4 bank groups for $t_{CCDL} = 3^tCK$ and 4^tCK
- Programmable READ latency
- Programmable WRITE latency
- Write data mask function via CA bus with single and double byte mask granularity
- Data bus inversion (DBI) and CA bus inversion (CABI)
- Input/output PLL
- CA bus training: CA input monitoring via DQ/DBI_n/EDC signals
- WCK2CK clock training with phase information via EDC signals
- Data read and write training via read FIFO (depth = 6)
- Read/write data transmission integrity secured by cyclic redundancy check using half data rate CRC
- Programmable CRC READ latency
- Programmable CRC WRITE latency
- Programmable EDC hold pattern for CDR
- RDQS mode on EDC pins

- Low power modes
- On-chip temperature sensor with read-out
- Auto precharge option for each burst access
- Auto refresh mode (32ms, 16k cycles) with per-bank and per-2-bank refresh options
- Temperature sensor controlled self refresh rate
- Digital 'RAS lockout
- On-die termination (ODT) for all high-speed inputs
- Pseudo open drain (POD135 and POD125) compatible outputs
- ODT and output driver strength auto calibration with external resistor ZQ pin (120Ω)
- Internal V_{REF} with DFE for data inputs, with input receiver characteristics programmable per pin
- Selectable external or internal V_{REF} for CA inputs; programmable V_{REF} offsets for internal V_{REF}
- Vendor ID for device identification
- IEEE 1149.1 compliant boundary scan
- 180-ball BGA package
- Lead-free (RoHS-compliant) and halogen-free packaging
- $T_C = 0^\circ C$ to $+95^\circ C$

Options¹

- Organization
 - 256 Meg x 32 (words x bits)
- FBGA package
 - 180-ball (12.0mm x 14.0mm)
- Timing – maximum data rate
 - 12 Gb/s
 - 14 Gb/s
 - 16 Gb/s
- Operating temperature
 - Commercial ($0^\circ C \leq T_C \leq +95^\circ C$)
- Revision

Data
 Command/Address
 Other signal
 Supply
 Ground

Note: 1. Channel A byte 1 and channel B byte 0 are disabled when the device is configured to x8 mode.

Table 1: 180-Ball FBGA Ball Descriptions

| Symbol | Type | Description |
|-------------------|-----------|---|
| CK_t, CK_c | Input | Clock: CK_t and CK_c are differential clock inputs. CK_t and CK_c do not have channel indicators as one clock is shared between both channel A and channel B on a device. Command address (CA) inputs are latched on the rising and falling edge of CK. All latencies are referenced to CK. |
| WCK_t, WCK_c | Input | Write clock: WCK_t and WCK_c are differential clocks used for write data capture and read data output. WCK_t/WCK_c are associated with DQ[15:0], DBI[1:0]_n, and EDC[1:0]. |
| CKE_n | Input | Clock enable: CKE_n LOW activates and CKE_n HIGH deactivates the internal clock, device input buffers, and output drivers excluding RESET_n, TDI, TDO, TMS, and TCK. Taking CKE_n HIGH provides PRECHARGE POWER-DOWN and SELF REFRESH operations (all banks idle), or ACTIVE POWER-DOWN (row ACTIVE in any bank). CKE_n must be maintained LOW throughout read and write accesses. |
| CA[9:0] | Input | Command address (CA): The CA inputs receive packetized DDR command, address or other information, for example, the op-code for the MRS command. See Command Truth Table for details. |
| CABI_n | Input | Command address bus inversion |
| DQ[15:0] | I/O | Data input/output: Bidirectional 16-bit data bus. |
| DBI[1:0]_n | I/O | Data bus inversion: DBI0_n is associated with DQ[7:0], DBI1_n is associated with DQ[15:8]. |
| EDC[1:0] | Output | Error detection code: The calculated CRC data is transmitted on these signals. In addition these signals drive a "hold" pattern when idle. EDC0 is associated with DQ[7:0], EDC1 is associated with DQ[15:8]. |
| V _{DDQ} | Supply | I/O power supply: Isolated on the die for improved noise immunity. |
| V _{DD} | Supply | Power supply |
| V _{SS} | Supply | Ground |
| V _{PP} | Supply | Pump voltage |
| V _{REFC} | Supply | Reference voltage for CA, CABI_n, and CKE_n signals |
| ZQ | Reference | External reference for auto calibration |
| TDI | Input | JTAG test data input |
| TDO | Output | JTAG test data output |
| TMS | Input | JTAG test mode select |
| TCK | Input | JTAG test clock |
| RESET_n | Input | Reset: RESET_n low asynchronously initiates a full chip reset. With RESET_n LOW all ODTs are disabled. A full chip reset may be performed at any time by pulling RESET_n LOW. |
| NC | – | No connect |

Note: 1. Index "_A" or "_B" represents the channel indicator "A" and "B" of the device. Signal names including the channel indicator are used whenever more than one channel is referenced, for example, with the ball assignment. The channel indicator is omitted whenever features and functions common to both channels are described.

Package Dimensions

Figure 3: 180-Ball FBGA (JE)

- Notes:
1. Package dimension specification is compliant to JC11 MO328 variation P14.0x12.0-GJ-180A.
 2. All dimensions are in millimeters.
 3. Solder ball material: SAC-Q (92.5% Sn, 4% Ag, 3% Bi, 0.5% Cu).

Functional Description

The GDDR6 SGRAM is a high-speed dynamic random-access memory designed for applications requiring high bandwidth. It is internally configured as 16-bank memory and contains 8,589,934,592 bits.

The GDDR6 SGRAM's high-speed interface is optimized for point-to-point connections to a host controller. On-die termination (ODT) is provided for all high-speed interface signals to eliminate the need for termination resistors in the system.

GDDR6 uses a $16n$ -prefetch architecture and a DDR or QDR interface to achieve high-speed operation. The device's architecture consists of two 16-bit-wide fully independent channels.

Read and write accesses to GDDR6 are burst oriented; accesses start at a selected location and consist of a total of 16 data words. Accesses begin with the registration of an ACTIVATE command, which is then followed by a READ, WRITE (WOM), or masked WRITE (WDM, WSM) command. The row and bank address to be accessed is registered coincident with the ACTIVATE command. The address bits registered coincident with the READ, WRITE, or masked WRITE command are used to select the bank and the starting column location for the burst access.

Clocking

GDDR6 operates from a differential clock CK_t and CK_c. CK is common to both channels. Command and address (CA) are registered at every rising and falling CK edge. There are both single-cycle and multi-cycle commands. See Command Truth Table for details.

GDDR6 uses a free running differential forwarded clock (WCK_t/WCK_c) with both input and output data registered and driven respectively at both edges of the forwarded WCK.

GDDR6 supports DDR and QDR operating modes for WCK frequency which differ in the DQ/DBI_n pin to WCK clock frequency ratio. The figure below illustrates the difference between both modes.

This GDDR6 SGRAM device is designed with a WCK/word granularity which is equivalent to one WCK per channel. The DRAM info bits for WCK granularity, WCK frequency, and internal WCK can be read by the host during the initialization process to determine the WCK architecture for the device.

Table 2: Example Clock and Interface Signal Frequency Relationship

| Pin | DDR WCK | QDR WCK | Unit |
|-------------------------------------|---------|---------|----------|
| CK _t , CK _c | 1.5 | 1.5 | GHz |
| CA | 3.0 | 3.0 | Gb/s/pin |
| WCK _t , WCK _c | 6.0 | 3.0 | GHz |
| DQ, DBI _n | 12.0 | 12.0 | Gb/s/pin |
| EDC | 6.0 | 6.0 | Gb/s/pin |

Figure 4: Clocking and Interface Relationship

Note: 1. The figure shows the relationship between the data rate of the buses and the clocks; it is not a timing diagram.

Figure 5: Block Diagram of an Example Clock System

Addressing

GDDR6 addressing is defined for a single channel with devices having two channels per device.

Table 3: Addressing

| Parameter | 8Gb Density | |
|-------------------------------|-------------|---------|
| | x16 Mode | x8 Mode |
| Number of channels | 2 | |
| Memory density (per channel) | 4Gb | |
| Memory prefetch (per channel) | 256b | 128b |
| Bank address (per channel) | BA[3:0] | |
| Row address (per channel) | R[13:0] | |
| Column address (per channel) | C[5:0] | C[6:0] |
| Page size (per channel) | 2KB | |
| Refresh | 16k/32ms | |

- Notes:
1. The column address notation for GDDR6 does not include the lower four address bits as the burst order is always fixed for READ and WRITE.
 2. Page size = $2^{\text{COLBITS}} \times (\text{Prefetch_Size}/8)$ where COLBITS is the number of column address bits.

Operations

Command Truth Table

GDDR6 uses a packetized DDR command/address bus that encodes all commands and addresses on a 10-bit CA bus as outlined in the table below.

Figure 6: Command Truth Table

| Operation | Symbol | CK Edge | CKE_n | | CA9 | CA8 | CA7 | CA6 | CA5 | CA4 | CA3 | CA2 | CA1 | CA0 | Notes |

Notes: 1. H = Logic HIGH level; L = Logic LOW level; V = Valid signal (H or L, but not floating). R, F = Rising, Falling CK clock edge.

2. Values shown for CA[9:0] are logical values; the physical values are inverted when command/address bus inversion (CABI) is enabled and CABI_n = L.
3. M[3:0] provide the mode register address (MRA), OP[11:0] the opcode to be loaded.
4. BA[3:0] provide the bank address, R[13:0] provide the row address.
5. B[3:0] provide the bank address, C[6:0] provide the column address; no sub-word addressing within a burst of 16. BST[15:0] provide the write data mask for each burst position with WDM(A) and WSM(A) commands.
6. CE (channel enable) is intended for PC mode. The command is active when CE = H. When CE = L the data access is suppressed.
7. The command is REFRESH or PER-BANK REFRESH/PER-2-BANK REFRESH when CKE_n(n) = L and SELF REFRESH ENTRY when CKE_n(n) = H.
8. B[3:0] select the burst position, and D[9:0] provide the data.
9. BA[3:0] provide the bank address.
10. All three encodings perform the same NOP. NOP (2) and NOP (3) encodings are only allowed during CA Training.

Clamshell (x8) Mode Enable

A GDDR6 SGRAM-based memory system is typically divided into several channels. GDDR6 has been optimized for a 16-bit-wide channel. A channel can be comprised of a single device operated in x16 mode, or two devices each operated in x8 mode. For x8 mode the devices are typically assembled on opposite sides of the PCB in what is referred as a clamshell layout.

Whether in x16 mode or x8 mode the device will operate with a point-to-point connection on the high-speed data signals. The disabled signals in x8 mode should all be in a High-Z state, non-terminating.

The x8 mode is detected at power-up on EDC1_A and EDC0_B. For x8 mode these signals are tied to V_{SS}; they are part of the bytes that are disabled in this mode and therefore not needed for EDC functionality. For x16 mode these signals are active and always terminated to V_{DDQ} in the system or by the controller.

The configuration is set with RESET_n going HIGH. Once the configuration has been set, it cannot be changed during normal operation. Typically, the configuration is fixed in the system. Details of the x8 mode detection are depicted in Figure 8. A comparison of x16 mode and x8 mode systems is shown in Figure 9.

Table 4: Clamshell (x8) Mode Enable

| Mode | EDC0_A | EDC1_A | EDC0_B | EDC1_B |
|------|---|----------------------------|----------------------------|------------------|
| x8 | V _{DDQ} | V _{SS} (on board) | V _{SS} (on board) | V _{DDQ} |
| x16 | V _{DDQ} (terminated by the system or controller) | | | |

Figure 8: Enabling Clamshell (x8) Mode

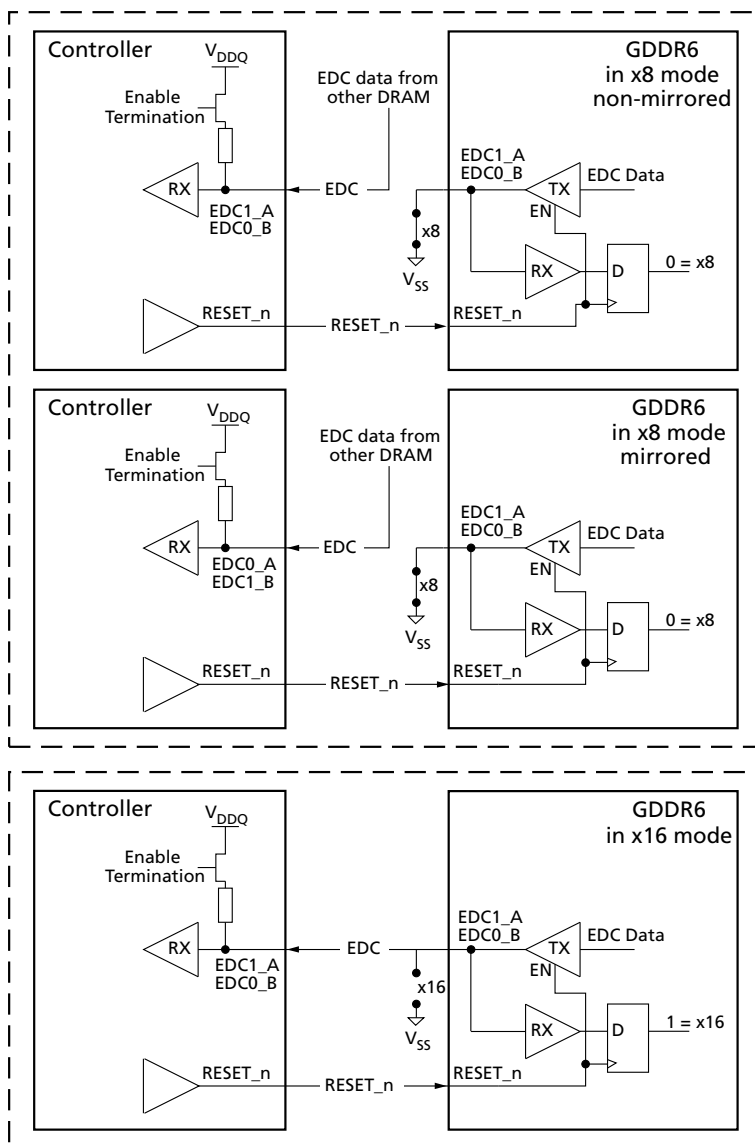

Figure 9: System View for x16 and x8 Modes

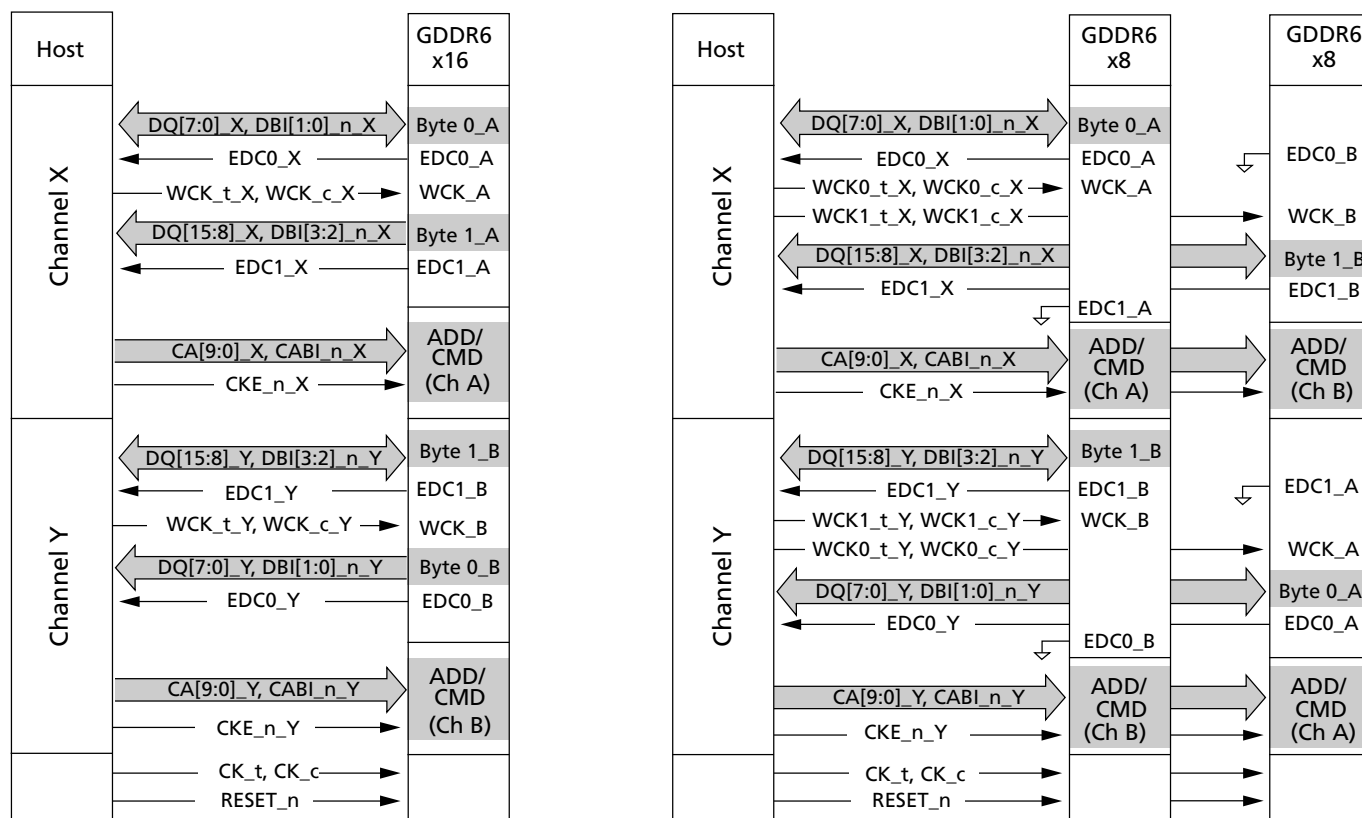

Figure 10 clarifies the use of x8 mode and how the bytes are enabled/disabled to give the controller the view of the same bytes that a controller sees with a single x16 device. For a 16-bit channel using two devices in a clamshell design, byte 0 comes from channel A from the top device and byte 1 comes from channel B from the bottom device and will look equivalent at the controller to a x16 mode.

Figure 10: Byte Orientation in Clamshell Topology

Pseudo-Channel Mode

GDDR6 has been optimized for a 32B access across a 16-bit channel by providing a unique CA bus to each 16-bit-wide channel. For applications requiring fewer CA pins, GDDR6 includes support for a pseudo-channel (PC) mode where CA[9:4], CKE_n, and CABI_n on each channel are connected to a common bus, while CA[3:0] of each channel are connected to a separate bus. The command truth table is organized such that in PC mode the same command is decoded in both pseudo-channels, but READ and WRITE commands support a unique column address to each pseudo-channel. In PC mode, CKE_n and CABI_n are also shared across pseudo-channels.

In PC mode, the only difference in the DRAM is that termination on CA[9:4], CKE_n, and CABI_n can be configured differently from CA[3:0]. PC mode can be selected during initialization by driving CA6 = LOW on both channels when RESET_n is driven HIGH.

Figure 11: CA Pins in Pseudo-Channel Mode

Operating Conditions

Absolute Maximum Ratings

Stresses greater than those listed may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may adversely affect reliability.

Table 5: Absolute Maximum Ratings

| Symbol | Parameter | Min | Max | Unit | Notes |
|------------------|---|------|------|------|-------|
| V_{DD} | Voltage on V_{DD} pin relative to V_{SS} | -0.3 | 2.0 | V | 1 |
| V_{DDQ} | Voltage on V_{DDQ} pin relative to V_{SS} | -0.3 | 2.0 | V | 1 |
| V_{PP} | Voltage on V_{PP} pin relative to V_{SS} | -0.3 | 2.3 | V | 2 |
| V_{IN}/V_{OUT} | Voltage on any pins relative to V_{SS} | -0.3 | 2.0 | V | |
| T_{STG} | Storage temperature | -55 | +125 | °C | |

- Notes:
1. V_{DD} and V_{DDQ} must be within 300mV of each other at all times the device is powered-up.
 2. V_{PP} must be equal or greater than V_{DD} and V_{DDQ} at all times the device is powered-up.

DC and AC Operating Conditions

The interface of GDDR6 with 1.35V V_{DDQ} will follow the POD135 Standard (JESD8-21), Class D; The interface with 1.25V V_{DDQ} will follow the POD125 Standard (JESD8-30), Class A. All AC and DC values are referenced to the ball.

Table 6: DC Operating Conditions

| Symbol | Parameter | POD135 | | | POD125 | | | Unit | Notes |
|-----------------------|---|---------------------------|------|---------------------------|---------------------------|------|---------------------------|------|---------|
| | | Min | Typ | Max | Min | Typ | Max | | |
| V _{DD} | Device supply voltage | 1.3095 | 1.35 | 1.3905 | 1.2125 | 1.25 | 1.2875 | V | 1 |
| V _{DDQ} | Output supply voltage | 1.3095 | 1.35 | 1.3905 | 1.2125 | 1.25 | 1.2875 | V | 1 |
| V _{PP} | Pump voltage | 1.746 | 1.8 | 1.908 | 1.746 | 1.8 | 1.908 | V | 2 |
| V _{REFD} | Reference voltage for DQ and DBI_n | 0.69 × V _{DDQ} | – | 0.71 × V _{DDQ} | 0.69 × V _{DDQ} | – | 0.71 × V _{DDQ} | V | 3, 4 |
| V _{REFD2} | | 0.49 × V _{DDQ} | – | 0.51 × V _{DDQ} | 0.49 × V _{DDQ} | – | 0.51 × V _{DDQ} | V | 3, 4, 5 |
| V _{REFC} | Reference voltage for CA | 0.69 × V _{DDQ} | – | 0.71 × V _{DDQ} | 0.69 × V _{DDQ} | – | 0.71 × V _{DDQ} | V | 3, 6 |
| V _{REFC2} | | 0.49 × V _{DDQ} | – | 0.51 × V _{DDQ} | 0.49 × V _{DDQ} | – | 0.51 × V _{DDQ} | V | 3, 6, 7 |
| V _{IHA(DC)} | DC input logic HIGH voltage with V _{REFC} for CA | V _{REFC} + 0.135 | – | – | V _{REFC} + 0.125 | – | – | V | |
| V _{ILA(DC)} | DC input logic LOW voltage with V _{REFC} for CA | – | – | V _{REFC} - 0.135 | – | – | V _{REFC} - 0.125 | V | |
| V _{IHA2(DC)} | DC input logic HIGH voltage with V _{REFC2} for CA | V _{REFC2} + 0.27 | – | – | V _{REFC2} + 0.25 | – | – | V | |
| V _{ILA2(DC)} | DC input logic LOW voltage with V _{REFC2} for CA | – | – | V _{REFC2} - 0.27 | – | – | V _{REFC2} - 0.25 | V | |
| V _{IHD(DC)} | DC input logic HIGH voltage with V _{REFD} for DQ and DBI_n | V _{REFD} + 0.09 | – | – | V _{REFD} + 0.085 | – | – | V | |
| V _{ILD(DC)} | DC input logic LOW voltage with V _{REFD} for DQ and DBI_n | – | – | V _{REFD} - 0.09 | – | – | V _{REFD} - 0.085 | V | |
| V _{IHD2(DC)} | DC input logic HIGH voltage with V _{REFD2} for DQ and DBI_n | V _{REFD2} + 0.27 | – | – | V _{REFD2} + 0.25 | – | – | V | |
| V _{ILD2(DC)} | DC input logic LOW voltage with V _{REFD2} for DQ and DBI_n | – | – | V _{REFD2} - 0.27 | – | – | V _{REFD2} - 0.25 | V | |
| V _{IHR} | RESET_n and boundary scan input logic HIGH voltage; EDC and CA input logic HIGH voltage for x16/x8 mode, PC vs. 2-channel mode, CK and CA ODT select at reset | 0.8 × V _{DDQ} | – | – | 0.8 × V _{DDQ} | – | – | V | 8 |
| V _{ILR} | RESET_n and boundary scan input logic LOW voltage; EDC and CA input logic LOW voltage for x16/x8 mode, PC vs. 2-channel mode, CK and CA ODT select at reset | – | – | 0.2 × V _{DDQ} | – | – | 0.2 × V _{DDQ} | V | 8 |
| V _{IN} | Single ended clock input voltage level: CK_t, CK_c, WCK_t, WCK_c | –0.30 | – | V _{DDQ} + 0.30 | –0.30 | – | V _{DDQ} + 0.30 | V | 14 |
| V _{MP(DC)} | CK_t, CK_c clock input midpoint voltage | V _{REFC} - 0.10 | – | V _{REFC} + 0.10 | V _{REFC} - 0.10 | – | V _{REFC} + 0.10 | V | 9, 12 |

Table 6: DC Operating Conditions (Continued)

| Symbol | Parameter | POD135 | | | POD125 | | | Unit | Notes |
|------------------------|---|--------|-----|------|--------|-----|------|------|--------|
| | | Min | Typ | Max | Min | Typ | Max | | |
| V _{IDCK(DC)} | CK_t, CK_c clock input differential voltage | 0.198 | – | – | 0.18 | – | – | V | 10, 12 |
| V _{IDWCK(DC)} | WCK_t, WCK_c clock input differential voltage | 0.18 | – | – | 0.165 | – | – | V | 11, 13 |
| I _L | Input leakage current (any input 0V ≤ V _{IN} ≤ V _{DDQ} ; all other signals not under test = 0V) | –5 | – | 5 | –5 | – | 5 | μA | |
| I _{OZ} | Output leakage current (outputs are disabled; 0V ≤ V _{OUT} ≤ V _{DDQ}) | –5 | – | 5 | –5 | – | 5 | μA | |
| V _{OL(DC)} | Output logic low voltage | – | – | 0.56 | – | – | 0.52 | V | |
| ZQ | External resistor value | 115 | 120 | 125 | 115 | 120 | 125 | Ω | |

- Notes:
1. GDDR6 SGRAM devices are designed to tolerate PCB designs with separate V_{DD} and V_{DDQ} power regulators.
 2. DC bandwidth is limited to 20 MHz.
 3. AC noise in the system is estimated at 50mV peak-to-peak for the purpose of DRAM design.
 4. The reference voltage source and control for DQ and DBI_n pins are determined by half V_{REFD}, and V_{REFD} level mode register bits.
 5. Programmable V_{REFD} levels are not supported with V_{REFD2}.
 6. The reference voltage source (external or internal) is determined at power-up; the reference voltage level is determined by half V_{REFC} and the V_{REFC} offset mode register bit.
 7. Programmable V_{REFC} offsets are not supported with V_{REFC2}.
 8. V_{IHR} and V_{ILR} apply to boundary scan input pins TDI, TMS, and TCK. V_{IHR} and V_{ILR} apply to EDC and CA inputs at reset when latching default device configurations. V_{IHR} and V_{ILR} also apply to CA, CABI_n, CKE_n, CK, DQ, DBI_n, EDC, and WCK inputs when boundary scan mode is active and input data are latched in the capture-DR TAP controller state.
 9. This provides a minimum of 0.845V to a maximum of 1.045V with POD135, and a minimum of 0.775V to a maximum of 0.975V with POD125, and is normally 70% of V_{DDQ}. DRAM timings relative to CK cannot be guaranteed if these limits are exceeded.
 10. V_{IDCK} is the magnitude of the difference between the input level in CK_t and the input level on CK_c. The input reference level for signals other than CK_t and CK_c is V_{REFC}.
 11. V_{IDWCK} is the magnitude of the difference between the input level in WCK_t and the input level on WCK_c. The input reference level for signals other than WCK_t and WCK_c is either V_{REFC}, V_{REFC2}, V_{REFD}, or V_{REFD2}.
 12. The CK_t and CK_c input reference level (for timing referenced to CK_t and CK_c) is the point at which CK_t and CK_c cross. Refer to the applicable timings in the AC Timings table.
 13. The WCK_t and WCK_c input reference level (for timing referenced to WCK_t and WCK_c) is the point at which WCK_t and WCK_c cross. Refer to the applicable timings in the AC Timings table.
 14. Use V_{IHR} and V_{ILR} when boundary scan mode is active and input data are latched in the capture-DR TAP controller state.

Table 7: AC Operating Conditions (For Design Only⁹)

| Symbol | Parameter | POD135 | | | POD125 | | | Unit | Notes |
|------------------------|---|---------------------------|-----|---------------------------|----------------------------|-----|----------------------------|------|------------|
| | | Min | Typ | Max | Min | Typ | Max | | |
| V _{IHA(AC)} | AC input logic HIGH voltage with V _{REFC} for CA | V _{REFC} + 0.18 | – | – | V _{REFC} + 0.165 | – | – | V | |
| V _{ILA(AC)} | AC input logic LOW voltage with V _{REFC} for CA | – | – | V _{REFC} - 0.18 | – | – | V _{REFC} - 0.165 | V | |
| V _{IHA2(AC)} | AC input logic HIGH voltage with V _{REFC2} for CA | V _{REFC2} + 0.36 | – | – | V _{REFC} + 0.333 | – | – | V | |
| V _{ILA2(AC)} | AC input logic LOW voltage with V _{REFC2} for CA | – | – | V _{REFC2} - 0.36 | – | – | V _{REFC} - 0.333 | V | |
| V _{IHD(AC)} | AC input logic HIGH voltage with V _{REFD} for DQ, DBI_n | V _{REFD} + 0.135 | – | – | V _{REFD} + 0.125 | – | – | V | |
| V _{ILD(AC)} | AC input logic LOW voltage with V _{REFD} for DQ, DBI_n | – | – | V _{REFD} - 0.135 | – | – | V _{REFD} - 0.125 | V | |
| V _{IHD2(AC)} | AC input logic HIGH voltage with V _{REFD2} for DQ, DBI_n | V _{REFD2} + 0.36 | – | – | V _{REFD2} + 0.333 | – | – | V | |
| V _{ILD2(AC)} | AC input logic LOW voltage with V _{REFD2} for DQ, DBI_n | – | – | V _{REFD2} - 0.36 | – | – | V _{REFD2} - 0.333 | V | |
| V _{IDCK(AC)} | CK_t, CK_c clock differential voltage | 0.36 | – | – | 0.333 | – | – | V | 1, 3, 5 |
| V _{IDWCK(AC)} | WCK_t, WCK_c clock input differential voltage | 0.27 | – | – | 0.25 | – | – | V | 1, 4, 6 |
| V _{IXCK(AC)} | CK_t, CK_c clock input crossing point voltage | V _{REFC} - 0.108 | – | V _{REFC} + 0.108 | V _{REFC} - 0.10 | – | V _{REFC} + 0.10 | V | 1, 2, 5 |
| V _{IXWCK(AC)} | WCK_t, WCK_c clock input crossing point voltage | V _{REFD} - 0.09 | – | V _{REFD} + 0.09 | V _{REFC} - 0.09 | – | V _{REFC} + 0.09 | V | 1, 2, 6, 7 |

- Notes:
1. For AC operations, all DC clock requirements must be satisfied as well.
 2. The value of V_{IXCK} and V_{IXWCK} is expected to equal 70% V_{DDQ} for the transmitting device and must track variations in the DC level of the same.
 3. V_{IDCK} is the magnitude of the difference between the input level on CK_t and the input level on CK_c. The input reference level for signals other than CK_t and CK_c is V_{REFC}.
 4. V_{IDWCK} is the magnitude of the difference between the input level on WCK_t and the input level on WCK_c. The input reference level for signals other than WCK_t and WCK_c is either V_{REFC}, V_{REFC2}, V_{REFD}, or V_{REFD2}.
 5. The CK_t and CK_c input reference level (for timing referenced to CK_t and CK_c) is the point at which CK_t and CK_c cross. Refer to the applicable timings in the AC Timings table.
 6. The WCK_t and WCK_c input reference level (for timing referenced to WCK_t and WCK_c) is the point at which WCK_t and WCK_c cross. Refer to the applicable timings in the AC Timings table.
 7. V_{REFD} is either V_{REFD} or V_{REFD2}.
 8. Figure 13 illustrates the exact relationship between (CK_t - CK_c) or (WCK_t - WCK_c) and V_{ID(AC)}, V_{ID(DC)}.
 9. The AC operating conditions are for DRAM design only and are valid on the silicon at the input of the receiver. They are not intended to be measured.

Figure 12: Voltage Waveform

Note: 1. V_{REF} , V_{IH} , and V_{IL} refer to whichever V_{REFxx} (V_{REFD} , V_{REFD2} , V_{REFC} , or V_{REFC2}) is being used.
